

INSARAP Workshop SEOM program element

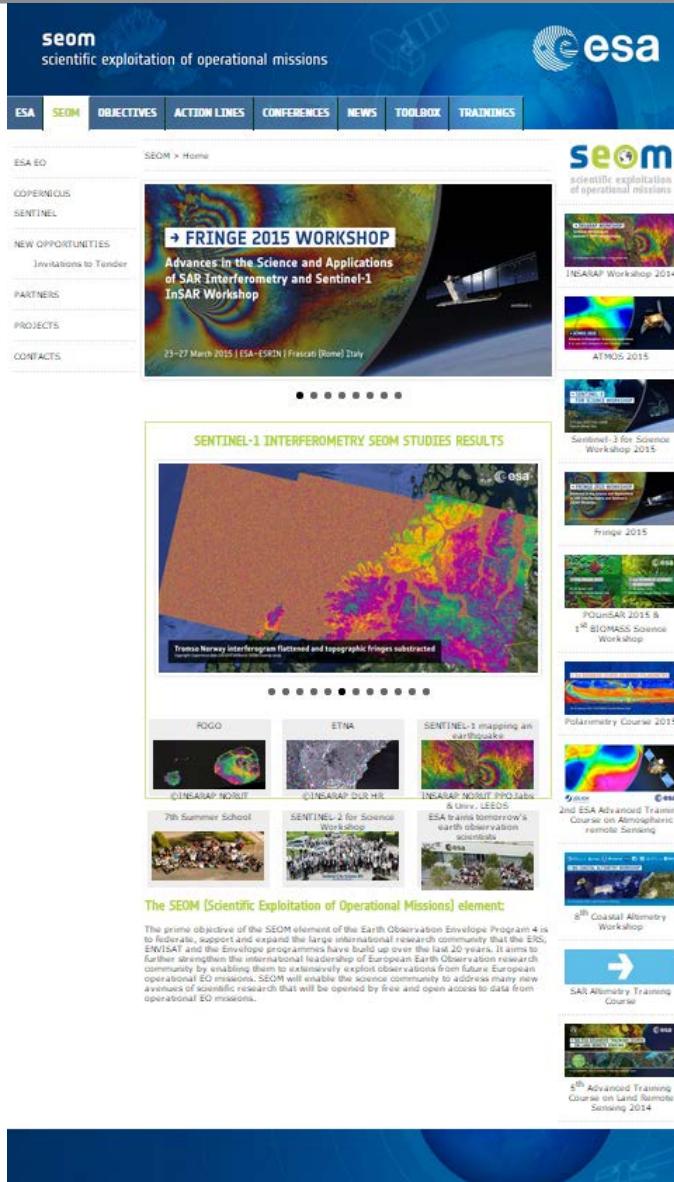

Yves-Louis DESNOS, Michael FOUMELIS, Peter REGNER, Claus ZEHNER, Steven DELWART, Marcus ENGDAHL, Jerome BENVENISTE, Ferran GASCON, Pierre-Philippe MATHIEU, Bojan BOJKOV, Craig DONLON, Malcolm DAVIDSON, Benjamin KOETZ, Philippe GORYL, Simon PINNOCK

European Space Agency ESRIN/ESTEC/HARWELL

SEOM objectives:

- Federate, support and expand the research community
- Strengthen the leadership of European EO research community
- Enable the science community to address new scientific research

Please visit SEOM.ESA.INT

The screenshot shows the SEOM website homepage. At the top, there's a navigation bar with links for ESA, SEOM, OBJECTIVES, ACTION LINES, CONFERENCES, NEWS, TOOLBOX, and TRAININGS. Below the navigation, there's a sidebar with links for ESA EO, COPERNICUS, SENTINEL, NEW OPPORTUNITIES (Invitations to Tender), PARTNERS, PROJECTS, and CONTACTS. The main content area features a large image of a satellite in space with the text '→ FRINGE 2015 WORKSHOP Advances in the Science and Applications of SAR Interferometry and Sentinel-1 InSAR Workshop' and the date '23–27 March 2015 | ESA-ESRIN, Frascati (Rome) Italy'. To the right of this are several smaller thumbnail images for other events like 'ATMOS 2015', 'Sentinel-3 for Science Workshop 2015', 'POLInSAR 2015 & 1st BIOMASS Science Workshop', 'Polinarity Course 2015', '2nd ESA Advanced Training Course on Atmospheric Remote Sensing', and '5th Advanced Training Course on Land Remote Sensing 2014'. Below these thumbnails, there are sections for 'SENTINEL-1 INTERFEROMETRY SEOM STUDIES RESULTS' (with an image of a map titled 'Tromsø Norway interferogram flattened and topographic fringes subtracted'), 'POGO' (with an image of a globe), 'ETNA' (with an image of a volcano), 'SENTINEL-1 mapping an earthquake' (with an image of a map), 'CINSARAP NORNUD' (with an image of a globe), '7th Summer School' (with an image of a group of people), 'SENTINEL-2 for Science Workshops' (with an image of a group of people), 'INSARAP MONIT PROJabs & Univ. LEEDS' (with an image of a globe), 'ESA trains tomorrow's earth observation scientists' (with an image of a globe), 'The 8th Coastal Altimetry Workshop' (with an image of a globe), and 'SAF Altimetry Training Course' (with an image of a globe). A detailed description of the SEOM element is provided at the bottom of the page.

The SEOM (Scientific Exploitation of Operational Missions) element:

The prime objective of the SEOM element of the Earth Observation Envelope Program-4 is to federate, support and expand the large international research community that the EOs, ENVISAT and the Envelope programmes have built up over the last 20 years. It aims to further strengthen the international leadership of European Earth Observation research community and to facilitate the exploitation of existing and future observational data from operational EO missions. SEOM will enable the science community to address many new avenues of scientific research that will be opened by free and open access to data from operational EO missions.

Action Lines

Science Users Consultations

Organising a series of regular international **thematic workshops** for science users consultation and gathering users feedback

Scientific Toolboxes Development

Developing, validating and maintaining open-source, multi-mission, **scientific software toolboxes**

Research & Development Studies

Launching state-of-the-art **R&D studies** for scientific exploitation of operational missions

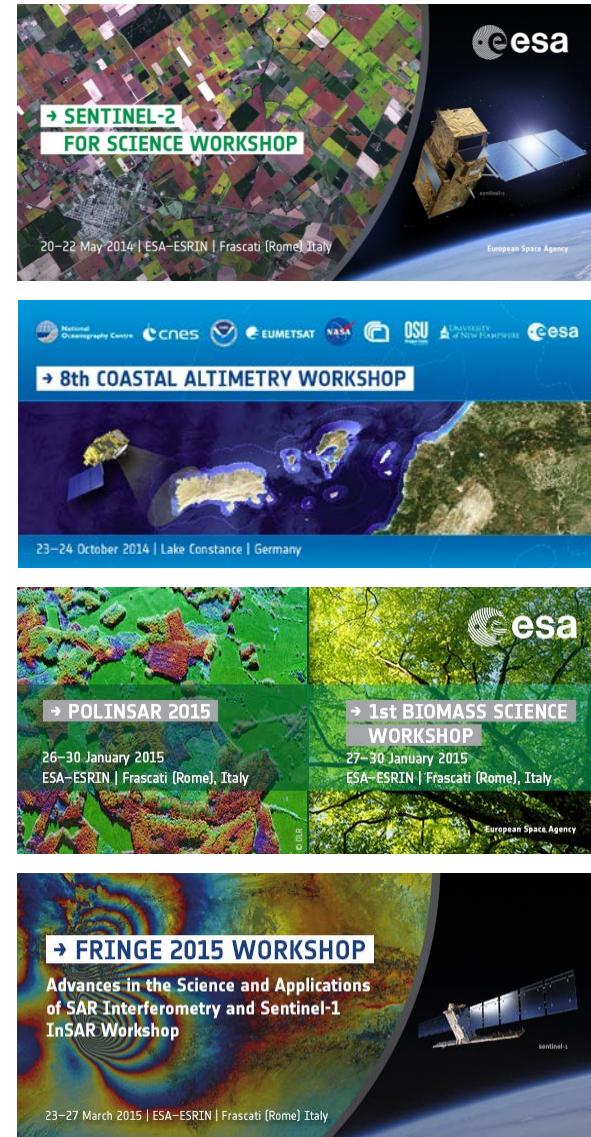

Training Next Generation of EO Scientists

Offering a multi-year programme of advanced international **training courses**, summer schools and educational materials

Promoting Science Data Use and Results

Promoting scientific use of data and ensuring a responsive ESA channel for regular, timely, high-quality **scientific publications**

Sentinel1/2/3 Toolboxes

- Scientific Toolboxes facilitating the exploitation of Sentinel 1/2/3 data
- Developed as open source software
- The S1/S2/S3 toolboxes share a common architecture and are multi-missions
- Support ERS/ENVISAT and 3rd Party SAR & VIS/NIR/TIR imaging sensors
- Based on evolution of the ENVISAT-TPM toolboxes (BEAM/NEST/ORFEO)
- Sentinel toolboxes are specified to be portable to a Cloud infrastructure
- Three toolboxes developed in coordination by ESA with regular developer forums

Available at <https://sentinel.esa.int/>

Sentinel-1A Napa Valley Earthquake

INSARAP (NORUT-PPO.labs-Univ. Leeds-COMET)

Sentinel-1 maps earthquake

The biggest earthquake in 25 years struck California's Napa Valley in the early hours of 24 August 2014. By processing two Sentinel-1A images, acquired on 7 August and 31 August 2014 an interferogram was generated. Deformation on the ground causes phase changes in radar signals that appear as the rainbow-coloured patterns around the Napa Valley. Each colour cycle corresponds to a deformation of 28 mm deformation. The maximum deformation is more than 10 cm, and an area of about 30x30 km was affected significantly.

ESA OBSERVING THE EARTH COPERNICUS SENTINEL-1

Search here

SENTINEL-1 POISED TO MONITOR MOTION

26 August 2014 Although it was only launched a few months ago and is still being commissioned, the new Sentinel-1A radar satellite has already shown that it can be used to generate 3D models of Earth's surface and will be able to closely monitor land and ice surface deformation.

As the first in a fleet of satellite missions for Europe's Copernicus environmental monitoring programme, Sentinel-1A was launched on 3 April. It carries an advanced radar instrument to image Earth's surface through cloud and rain, regardless of whether it is day or night.

Among its many applications it will routinely monitor shipping zones, map sea ice and provide information on winds and waves for marine traffic, track changes in the way land is being used, provide imagery for rapid response to disasters such as floods, and monitor uplift and subsidence.

Sentinel-1 INSARAP Workshop

Background

The European Space Agency, in the context of the Scientific Exploitation of Operational Missions (SEOM) element INSARAP studies, is organising a technical workshop on Sentinel-1 TOPS interferometry from **10 to 11 December 2014** in ESA-ESRIN, Frascati. During the event, results obtained by the two INSARAP consortia will be presented.

Background

- In the context of the Scientific Exploitation of Operational Missions (SEOM) element INSARAP studies, is organising a technical workshop on Sentinel-1 TOPS interferometry
- During the event, results obtained by the two INSARAP consortia will be presented.

**SENTINEL-1 INSAR
ON A CONTINENTAL
SCALE**

AUG/DEC 2014

RESULTS DESCRIPTION

This 1400km x 250km interferogram covers the Center and South parts of Italy including Sicily, and captures large parts of Slovenia and Croatia. It starts by just capturing a small part of Malta, and ends in the Alps over Slovenia and Austria. In total 8 consecutive IW SLC slices were used in the interferogram formation, specifically, data takes from 09-Aug-2014 and 21-Aug-2014. Notably, this interferogram was computed as a single dataset.

The impressive scale, coverage and coherence clearly demonstrate the potential of Sentinel-1 for many remote sensing and interferometric applications. It also clearly introduces, what will be perhaps be the major challenge in interpretation and analysis of Sentinel-1 interferometric data, and that is the mitigation of the atmospheric effects.

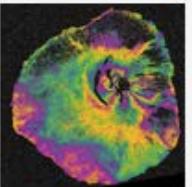

Also, for a slow TV fans, an interferometric fly-through results is available on YouTube, in a short 90 seconds version, and a super slow 2.5 hours version.

**FOGO VOLCANO
ERUPTION
OBSERVED BY
SENTINEL-1**

NOVEMBER 2014

RESULTS DESCRIPTION

The potential and capability of Sentinel-1 TOPS for geophysical applications has yet again been demonstrated. This beautiful interferogram was computed by combining two radar images acquired over the Fogo Island during the time of a volcanic eruption. Specifically, it was computed by combining images acquired on 3rd and 27th of November, both in a ascending Interferometric Wide Swath mode.

Together with the Napa Valley Earthquake study, and now with the satellite in the operational stage, the full potential of Sentinel-1 for relief efforts has been once again unequivocally demonstrated.

While more information on the interpretation and geophysical modeling will soon follow, for more context you can refer to the Copernicus EMS "The MIA-VITA Monitoring Seismic Network of Fogo Volcano" project, and watch the actual footage of the eruption.

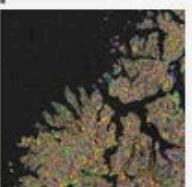

Interferometric results available to download soon!

**SENTINEL-1 TOPS
INTERFEROGRAM**

AUGUST 2014

RESULTS DESCRIPTION

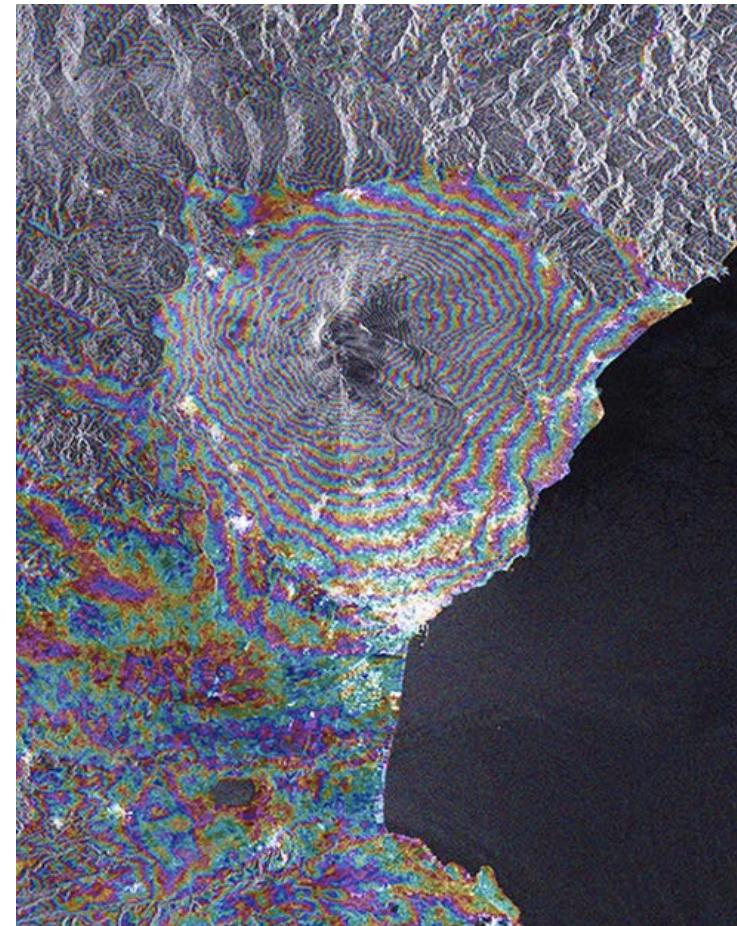

This is one of the first Sentinel-1A TOPS interferograms. It is computed by combining two radar images of the northern coast of Norway acquired by on 11 August and 23 August 2014. Although Sentinel-1A is still being commissioned, this new result clearly demonstrates usefulness and applicability of Sentinel-1 TOPS mode to map the shape of the land and monitor ground movement.

One of the InSARap pilot sites, Nordnes, is situated in the Lyngen Alps, in the rightmost part of the interferogram. The area is particularly prone to landslides, and the particularly dangerous landslide at Nordnes is subject to

Technical Objectives

- Present Sentinel-1 interferometric results in TOPS mode.
- Adapt InSAR and PSI processing techniques to TOPS SAR data.
- Discuss the first InSAR and PSI results over selected pilot sites.
- Assess the synergy between Sentinel-1 and previous C-band SAR missions.

Additional Objectives

- Dialogue with INSAR specialists
- Gather your feedback on ESA products, tools and services for the INSAR science community
- Prepare for FRINGE 2015
- Share the KNOW-HOW for Sentinel 1 INSAR scientific exploitation
- Propose Sentinel-1 INSAR session(s) at IGARSS 2015 in Milano
